AMENDMENTS TO THE SPECIFICATION

Kindly replace the first paragraph in the specification with the following amended paragraph:

This application is a continuation-in-part of U.S. Application No.09/955,729, now abandoned, filed September 19, 2001, which is a divisional application of U.S. Application No. 09/679,959, now U.S. Patent No. 6,319,997, filed October 5, 2000, which is a divisional application of U.S. Application No. 09/313,818, now U.S. Patent No. 6,204,344, filed May 18, 1999, which is a continuation-in-part of U.S. Application Nos. 09/080,412, now abandoned, and 09/081,392, now U.S. Patent No. 6,281,300, both filed May 18, 1998, which both claim the benefit of U.S. Provisional Application No. 60/078,859, now abandoned, filed March 20, 1998. Each application in this chain of priority is incorporated by reference herein in its entirety.

Kindly replace the Abstract with the following amended Abstract:

A process/apparatus is disclosed for continuously separating a liquid medium comprising diluent and unreacted monomers from a polymerization effluent comprising diluent, unreacted monomers and polymer solids, comprising a continuous discharge of the polymerization effluent from of a slurry loop reactor containing a flow of slurry therein, comprising a discharge conduit extending a distance into the loop reactor; the conduit having a longitudinal axis and an opening inside the loop reactor; at least a portion of the conduit being curved along its longitudinal axis inside the loop reactor; and the opening substantially facing the flow of the slurry, wherein the discharge conduit is located within a lower leg of the loop reactor such that a continuous discharge of the polymerization effluent from a slurry reactor through a discharge valve and transfer conduit into a first intermediate pressure flash tank with a conical bottom defined by substantially straight sides inclined at an angle to that of horizontal equal to or greater than the angle of slide of the slurry/polymer solids and an exit seal chamber of such diameter (d) and length (l) as to maintain a desired volume of concentrated polymer solids/slurry in the exit seal chamber such as to form a pressure seal while continuously discharging a plug flow of concentrated polymer solids/slurry bottom

product of the first flash tank from the exit seal chamber through a seal chamber exit reducer with inclined sides defined by substantially straight sides inclined at an angle to that of herizontal equal to or greater than the angle of clide of wherein volatile inert diluent and unreacted monomers are removed and the polymer solids which remain after removal of about 50 to 100% of the inert diluent therefrom to a second flash tank at a lower pressure.
